

# React: WEEKEND ASSIGNMENT

## React – Small ecommerce site

The following exercise contains the following subjects:

- JSX
- Props
- State
- Route
- Api

### Instructions:

We're going to create an e-commerce site.

You can choose any product you want

### Display:

- Top menu, home button, products page button, button that leads to the cart, next to it there is a counter that shows the amount of products in the cart.
- Products page, will display the products you received from API.
  - Each product card will display a photo description and an add button to the cart
- Cart page, will display all the products you added to the cart on the product page.
  - Each product in the cart will show the quantity of products we have chosen to buy. We can add to the quantity and subtract from the quantity.

### The flow of the app:

When you enter the site you come to an opening page.

Once we click on the products page we will move to it and we will be presented with all the products we can add to the cart.

If we click on the Add to Cart button we will see the counter in the cart in the top menu updated in one.

The cart page will show us all the products we added to the cart.

If the complete payment is pressed, we will empty the products from the cart.
